

Surprises from the out-of-equilibrium dynamics of mean-field spin glasses

Federico Ricci-Tersenghi

Sapienza University, Roma, Italy

Almost 30 years after the solution to the off-equilibrium dynamics of long-range spin glasses based on the weak ergodicity breaking hypothesis, we are finding several pieces of evidence that such an assumption is not always correct. I will present this evidence and discuss the new physics that is emerging from the out-of-equilibrium dynamics of mean-field spin glasses.
